⚖️ AI Finance · two-DEX arbitrage **Connect**

DEX A · 1 MAX	price gap	DEX B · 1 MAX
2,069	0.6%	2,056

↔ Gap! **Buy MAX on DEX B** (cheaper) → **Sell on DEX A** (dearer) → pocket the spread.

wallet: — MAX · — tUSDC · session P&L: — tUSDC

🦄 DEX A

2,068.68

98.39 MAX / 203,542 tUSDC

Buy MAX — spend tUSDC

tUSDC **Buy**

Sell MAX — for tUSDC

MAX **Sell**

🍣 DEX B

2,055.6

98.64 MAX / 202,765 tUSDC

Buy MAX — spend tUSDC

tUSDC **Buy**

Sell MAX — for tUSDC

MAX **Sell**

TEST TOKENS

+1000 MAX **+1000 tUSDC** **Import MAX** **Import tUSDC**

💡 **Two separate DEXes, same pair.** A Factory allows only one pool per pair, so a second market = a second AMM (this is Uniswap vs Sushiswap). They don't know each other's price. **Make one diverge** (a big Buy on DEX A pushes MAX up there), then **arbitrage**: Buy MAX cheap on the low DEX, Sell it on the high DEX → your tUSDC grows and the two prices converge. That closing force is what keeps real markets aligned.
